# **1.1 About this Manual**

- This Manual contains important information, guiding principles, operation, and maintenance of the product, and applies to the model: ASP U series
- Users must follow the instructions in this Manual during installation, use and maintenance

# 1.2 Symbols and description

| Symbol           | Description   |
|------------------|---|
| <b>ADANGER</b>   | Dangerous situations that will lead to death or serious injury when ignored |
| A WARING         | Dangerous situations that may lead to death or serious injury when ignored  |
| ΔCAUTION         | Dangerous situations that may lead to mild or moderate injury when ignored  |
| () <i>ΝΟΤΙCE</i> | Operation tips  |

# **1.3 Safety matters**

# A DANGER

- This chapter contains important safety matters. Please read and keep this Manual for future reference.
- Please make sure to comply with local requirements and regulations when installing the inverter.
- Be careful of high voltage. Before and during installation, please turn off the switch of each power supply to avoid electric shock.
- In order to achieve optimal operation of the inverter, please select the appropriate cable size and necessary protective devices according to regulations.
- Do not connect or disconnect any connections when the inverter is working.
- Do not open the terminal cover when the inverter is working.

# SRNEAbout the Product

# 2.1 Description

ASP series is a new type of solar storage inverter that integrates PV storage, mains charge, and energy storage and outputs sinusoidal AC. Equipped with DSP control and advanced control algorithm, it has high response speed and good reliability, and applies to industrial scenarios.

# 2.2 Features

• Support the connection of various types of energy storage batteries such as lead-acid battery and lithium-ion battery

• Have the dual activation function during lithium-ion battery sleep, that is, access to mains/PV power can activate the lithium-ion battery

- Support split-phase/single-phase pure sine wave output
- Support adjusting the voltage of each phase within the range of 100 Vac, 105 Vac, 110 Vac, 120 Vac and 127 Vac
- Support two-channel PV input and have the function of simultaneous two-channel maximum power point tracking (MPPT) for charging/carrying capacity
- Support two-channel MPPT, with an efficiency of up to 99.9% and a maximum single-channel current of 18 A, perfectly fitting high-power modules
- Provide 2 charge modes: only PV and grid + PV
- Have the timed charge and discharge function, that is, users can set the charge and discharge time according to the time-of-use price to save electricity costs
- Have the energy-saving mode, reducing no-load energy losses
- Provide two output modes: mains bypass output and inverter output, achieving uninterrupted power supply

• Support LCD display of dynamic flowchart, updating system data and operating status at any time

• Provide 360 ° protection, including short circuit protection, overcurrent protection, overvoltage and undervoltage protection, and overload protection

• Support CAN, USB, RS485 communication

# 2.3 System connection diagram

The following figure shows the system application scenario of the product. A complete system consists of the following parts:

- 1. **PV module:** It converts solar energy into DC to charge batteries or into AC to supply power to loads.
- 2. **Mains or generator:** Connected to AC input, it can charge batteries while supplying power to loads. When the battery and PV module supply power to the load, the system can generally operate without mains or generator.
- 3. **Battery:** The function of a battery is to ensure normal power supply for the system load when there is insufficient PV power and no mains.
- 4. **Household load:** It can connect various household and office loads, including refrigerators, lighting fixtures, TVs, fans, air conditioners, and other AC loads.
- 5. Inverter: It is the energy conversion device of the entire system.
- The actual application scenario determines the specific system wiring mode

# 3.1 Installation location

ASP series is only for indoor use (**protection level: IP20**). Before selecting the installation location, users should consider the following factors:

- A solid wall
- Installation height: flush with the line of sight
- Sufficient heat dissipation space
- Ambient temperature: -10°C-55°C (14°F-131°F), to ensure optimal operation

# 

- Do not install the inverter near highly flammable materials
- Do not install the inverter in potentially explosive areas
- Do not install the inverter and lead-acid battery in enclosed spaces

#### 

- Do not install the inverter in direct sunlight
- Do not install or use the inverter in damp environments

| 13 |   | Outgoing inspection<br>report      | 1pcs |

Drill 4 installation holes of the specified sizes on the wall with an electric drill, insert 2 expansion screws above, and fix the inverter with 2 M5 screws below.

# **3.4 Removal of terminal cover and insect-proof net**

#### 

• When using the inverter in areas with poor air quality, the dustproof net is easily blocked by air particles. Please regularly remove and clean it to avoid affecting the air flow rate inside the inverter; otherwise it may cause inverter overheating (19/20 fault), and affect power supply and the service life of the inverter

# 4.1 Wiring mode (depends on the output mode)

### • Split-phase mode (default)

| ltem                          | Description                        |

The cable size is for reference only. If the distance between the PV array and the inverter or between the inverter and the battery is long, using thicker cables will reduce voltage drop and improve system performance.

Connect the live wire, neutral wire, and ground wire according to the cable position and sequence shown in the following figure.

# 

- Before connecting AC input and output, be sure to disconnect the circuit breaker to avoid the risk of electric shock. Do not conduct live operation.
- Please check whether the cables used are sufficient to meet the requirements. Cables that are too thin or of poor quality may pose serious safety hazards.

# 4.4 Battery wiring

Connect the positive and negative cables of the battery according to the cable position and sequence shown in the following figure

# A DANGER

• Before connecting the battery, be sure to disconnect the circuit breaker to avoid the risk of electric shock. Do not conduct live operation.

• Please check the positive and negative terminals of the battery for correct connection and no reverse connection; otherwise it may damage the inverter.

• Please check whether the cables used are sufficient to meet the requirements. Cables that are too thin or of poor quality may pose serious safety hazards.

Connect the positive and negative terminals of the two-channel PV modules according to the cable position and sequence shown in the following figure.

#### A DANGER

- Before connecting PV modules, be sure to disconnect the circuit breaker to avoid the risk of electric shock. Do not conduct live operation.
- Please make sure that the open circuit voltage of the series connected PV modules does not exceed the maximum open circuit voltage of the inverter (in ASP series, this value is 550 V); otherwise the inverter may be damaged.

# 4.6 Dry contact wiring

Use a small-sized screwdriver to push back in the direction indicated by the arrow, and then insert the communication cable into the dry contact port. (Communication cable section:  $0.2 \text{ mm}^2-1.5 \text{ mm}^2$ )

Please ensure that the grounding terminal is reliably connected to the grounding busbar.

• The grounding cable size shall not be less than 4 mm<sup>2</sup> and shall be as close as possible to the grounding point

# 4.8 Inverter start

After confirming reliable wiring and correct wiring sequence, restore the terminal cover to its original position

- Step 1: Close the circuit breaker of the battery
- Step 2: Press the rocker switch at the bottom of the inverter, and the screen and indicator will light up, indicating that the inverter is enabled
- Step 3: Close the circuit breakers for PV input, AC input, and AC output in sequence
- Step 4: Start loads one by one in order of power from small to large

# 4.9 Parallel wiring

#### 4.9.1 Parallel operation

1. The parallel operation supports up to six solar storage inverters.

2. When using the parallel function, it is necessary to connect the parallel communication cable in a correct and reliable manner. See the figure blow for the communication cable (packaging accessory):

#### Parallel communication cable\*1

#### 4.9.2 Cautions for parallel connection

# **Warning**:

#### 1. PV wiring:

In parallel connection, the PV array of each inverter must be independent, and the PV array of PV1 and PV2 for one inverter must also be independent.

#### 2. Battery wiring

In single-phase or three-phase parallel connection, all solar storage inverters must be connected to the same battery, with BAT+ connected to BAT+ and BAT- to BAT-, and before power on and start-up, it is necessary to check and ensure correct connection, wiring length, and cable size, so as to avoid the abnormal operation of parallel system output caused by wrong connection.

#### 3. LOAD wiring:

In single-phase parallel connection, all solar storage inverters must be connected in the manner of L-to-L, N-to-N, and PE-to-PE, and before power on and start-up, it is necessary to check and ensure correct connection, wiring length, and cable size, so as to avoid the abnormal operation of parallel system output caused by wrong connection.

In three-phase parallel connection, all solar storage inverters must be connected in the manner of N-to-N and PE-to-PE. The L lines of all inverters in the same phase shall be connected together, but the AC output L lines of different phases shall not be connected together. Other cautions are the same as those for single-phase parallel connection.

#### 4. GRID and GEN wiring:

In single-phase parallel connection, all solar storage inverters must be connected in the manner of L-to-L, N-to-N, and PE-to-PE, and before power on and start-up, it is necessary to check and ensure correct connection, wiring length, and cable size, so as to avoid the abnormal operation of parallel system output caused by wrong connection. Meanwhile, it is not allowed to have multiple different AC source inputs to avoid damage to the external equipment of the inverter. The AC source input shall be consistent and unique.

In three-phase parallel connection, all solar storage inverters must be connected in the manner of N-to-N and PE-to-PE. The L lines of all inverters in the same phase shall be connected together, but the AC output L lines of different phases shall not be connected together. Other cautions are the same as those for single-phase parallel connection.

#### 5. Communication wiring:

Our company's communication cable for parallel operation is a DB15 standard computer cable with shielding function, and it is used for single-phase or three-phase parallel connection. Each inverter shall be connected with one out and one in, that is, the male connector (out) of the inverter is to be connected to the female connector (in) of the parallel inverter, not the one of the inverter. In addition, DB15 terminal screws will be used to tighten the communication cable of each parallel inverter to avoid falling off or poor contact of the communication cable, followed by abnormal operation or damage of the system output.

**6.** Before and after connecting the system, please carefully refer to the following system wiring diagrams to ensure that all wiring is correct and reliable before power on.

**7.** After the system is correctly wired, powered on, and in normal operation, if a new inverter needs to be connected, make sure to disconnect the battery input, PV input, AC input and AC output, and that all solar storage inverters are powered off before reconnecting into the system.

# 4.9.3Wiring diagram for single-phase parallel connection (phase difference between L1 and L2: 0°)

• The communication cable of parallel solar storage inverter is to be locked with screws after connecting. See the diagram below:

• See the diagram below for parallel connection

Set the item [31] to "PAL" and the item [68] to "0°." When setting the item [38] to "120 V," the output L-N voltage is 120 V

1. Two parallel-connected solar storage inverters:

#### 2. Three parallel-connected solar storage inverters:

3. Four parallel-connected solar storage inverters:

#### 4. Five parallel-connected solar storage inverters:

#### 5. Six parallel-connected solar storage inverters:

# 4.9.4 Wiring diagram for two-phase parallel connection (phase difference between L1 and L2: 0°)

- (1) P1: Set the item [31] to "2P0;" P2: Set the item [31] to "2P1," all of the P1/P2 inverter item [68] can not be set, it is default "0°" and the phase difference between P1 and P2 is 120°. When setting the item [38] to "120 V," the voltage between the live wire L1 of P1 phase and the live wire L2 of P2 phase is 208 V, and the L1-N voltage is 120 V
- (2) P1: Set the item [31] to "2P0;" P2: Set the item [31] to "2P2," all of the P1/P2 inverter item [68] can not be set, it is default "0°" and the phase difference between P1 and P2 is 180°. When setting the item [38] to "120 V," the voltage between the live wire L1 of P1 phase and the live wire L2 of P2 phase is 240 V, and the L1-N voltage is 120 V, L2-N voltage is 120V
- a. Split-phase system (two inverters)

1+1 system:

#### b. Split-phase system (three inverters)

2+1 system

c. Split-phase system (four inverters) 3+1 system:

d. Split-phase system (five inverters)

#### 4+1 system:

e. Split-phase system (six inverters) 5+1 system:

0 ...... 0 0 ...... 0

# 4.9.5 Wiring diagram for split-phase parallel connection (phase difference between L1 and L2: 180°)

Set the item [31] to PAL, and set the item [68] to 180°. When setting the item [38] to "120 V," the L1-L2 voltage is 240 V, and the L1-N voltage is 120 V, L2-N voltage is 120V

#### a. Two parallel-connected solar storage inverters:

b. Three parallel-connected solar storage inverters:

#### c. Four parallel-connected solar storage inverters:

#### d. Five parallel-connected solar storage inverters:

#### e. Six parallel-connected solar storage inverters:

#### 4.9.6 Wiring diagram for three-phase parallel connection

P1: Set the item [31] to "3P1;" P2: Set the item [31] to "3P2;" P3: Set the same to "3P3", all of P1/P2/P3 inverters item [68] can not be set, it is default "0°"

At this point, the P1-P2, P1-P3, and P2-P3 phase difference is 120°. When setting the item [38] to "120 VAC," the voltage between the live wire L1 of P1 phase and the live wire L2 of P2 phase is 120\*1.732=208 VAC. Similarly, the L1-L3 and L2-L3 voltage is 208 VAC:

#### a. Three-phase system (three inverters)

#### 1+1+1 system:

#### b. Three-phase system (four inverters)

2+1+1 system:

c. Three-phase system (five inverters) 3+1+1 system:

2+2+1 system:

d. Three-phase system (six inverters) 2+2+2 system:

Note:

1) Before powering on and lighting up the screen, check for correct wiring according to the above wiring diagrams to avoid system problems.

2) Check all connections for firm fixing to avoid detachment and abnormal system operation.

3) When connecting the AC output to the load, complete wiring according to the requirements of the electrical load to avoid damage to the load.

4) Set the item [38] to the same parameter, or only set it in the host inverter. During parallel operation, the voltage set in the host shall prevail, so the host inverter will forcibly set the item to the value for slave inverters. Only in standby mode can the item be set.

5) The inverter defaults to single mode at the factory. If using the parallel or three-phase function, set the item [31] on the screen as follows:

Power on one inverter each time, turn off the other inverters, and then set the item [31] according to the on-site system operation mode. After setting the inverter,

turn off the inverter, and set the other inverters one by one. After all are set, power on all inverters at one time to enter the working state.

#### In single-phase parallel operation:

Set the item [31] to "PAL" and the item [68] to "0°." When setting the item [38] to "120 V," the output L-N voltage is 120 V

#### In two-phase parallel operation:

(1) P1: Set the item [31] to "2P0;" P2: Set the item [31] to "2P1," all of P1/P2 inverters item [68] can not be set, it is default "0°" and the phase difference between P1 and P2 is 120°. When setting the item [38] to "120 V," the voltage between the live wire L1 of P1 phase and the live wire L2 of P2 phase is 208 V, and the L1-N voltage is 120 V

(2) P1: Set the item [31] to "2P0;" P2: Set the item [31] to "2P2," all of P1/P2 inverters item [68] can not be set, it is default "0°" and the phase difference between P1 and P2 is 180°. When setting the item [38] to "120 V," the voltage between the live wire L1 of P1 phase and the live wire L2 of P2 phase is 240 V, and the L1-N voltage is 120 V

#### In split-phase parallel operation:

Set the item [31] to PAL, and set the item [68] to  $180^{\circ}$ . When setting the item [38] to "120 V," the L1-L2 voltage is 240 V, and the L1-N voltage is 120 V

#### In three-phase parallel operation:

P1: Set the item [31] to "3P1;" P2: Set the item [31] to "3P2;" P3: Set the same to "3P3" all of P1/P2/P3 inverters item [68] can not be set, it is default "0°"

At this point, the P1-P2, P1-P3, and P2-P3 phase difference is 120°. When setting the item [38] to "120 VAC," the voltage between the live wire L1 of P1 phase and the live wire L2 of P2 phase is 120\*1.732=208 VAC. Similarly, the L1-L3 and L2-L3 voltage is 208 VAC:

6) After the system runs, measure the correct output voltage before connecting to loads.

# 5.1 Operation and display panel

The operation and display panel of the inverter includes one LCD screen, three indicators, and four physical buttons

## • Physical button

## 5.3 Timed charge/discharge function

ASP series has the timed power charge/discharge function. Users can set different charge and discharge periods according to the local time-of-use price, thus reasonably using mains and PV power. When mains is expensive, the battery inverter is used to supply power to the load; when mains is cheap, it can be used to supply power to and charge the load, thus helping users reduce electricity expenses to the full extent. Users can turn on/off the timed charge/discharge function in items 46 and 53 in the setup menu, and set charge and discharge periods in parameters 40-45 and 47-52.

The following is an example to help users understand the function.

Before using the function for the first time, please set the local time and date in parameters 54 and 55, and then you can set corresponding periods based on the local time-of-use price.

#### Timed charge and loading function

Timed battery discharge function

With 3 definable periods, users can freely set the mains charge/loading period in the range of 00:00-23:59. During the period set by the user, in case of PV energy output, it will be used inverter to load; if the battery power is first; in case of no PV energy output or lack of PV energy, mains will be used as a supplement. switch to mains to ensure stable operation of

With 3 definable periods, users can freely set the battery discharge period in the range of 00:00-23:59. During the period set by the user, the inverter will first use the battery insufficient, the inverter will automatically the load.

## 6.1 Overview

## 6.2 USB-B port

Users can use the upper computer software through the port to read and modify device parameters. If needing the installation package for the upper computer software, you can download it from the official website of SRNE, or contact us to get it.

The WIFI port is used to connect to the Wi-Fi/GPRS data acquisition module, and then users can view the operation status and parameters of the inverter via the mobile APP.

## 6.4 RS485/CAN port

The RS485/CAN port is used to connect to the BMS of the Li-ion battery.

| RJ45  | Definition |
|-------|------------|
| Pin 1 | RS485-B    |
| Pin 2 | RS485-A    |
| Pin 3 | /          |
| Pin 4 | CANH       |
| Pin 5 | CANL       |
| Pin 6 | /          |
| Pin 7 | RS485-A    |
| Pin 8 | RS485-B    |

Please contact us for firmware and CT if you need this function

## CT direction : to inverter

## 6.6 Dry contact port

### The dry contact port has 4 functions:

- 1. RSD power supply
- 2. Remote ON/OFF
- 3. Battery temperature sampling
- 4. Remote generator start/stop

| Function                              | Description  |
|---------------------------------------|--|
| RSD power supply                      | PIN 1 is GND, PIN 2 is RSD 12V+  |
| Remote ON/OFF                         | When pin 1 is connected to pin 3, the inverter will turn off the AC output.<br>When disconnected, the inverter is in normal output.  |
| Temperature<br>sampling<br>(reserved) | Pins 1 and 4 can be used for battery temperature sampling compensation.  |
| Remote generator<br>start/stop        | <ul> <li>When the battery voltage reaches the under-voltage alarm voltage</li> <li>(parameter 14) or the voltage threshold for mains to switch to the battery</li> <li>(parameter 04), pins 6 to 5 are normally open, and pins 7 to 5 are normally</li> <li>closed.</li> <li>When the battery voltage reaches the voltage threshold for the battery to</li> <li>switch to mains (parameter 05), or the battery is fully charged, pins 6 to 5 are</li> <li>normally closed, and pins 7 to 5 are normally open. (5/6/7 pin output: 125</li> <li>VAC/1 A, 230 VAC/1 A, and 30 VDC/1 A)</li> </ul> |

## **I** NOTICE

If you need to use the remote start/stop function of the generator with dry contact, please ensure that the generator has an ATS and supports remote start/stop.

# 7.1 Fault codes

| Fault<br>Code | Meaning          | Affect<br>Output or<br>Not | Description   |
|---------------|------------------|----------------------------|---|
| 01            | BatVoltLow       | Yes                        | Battery under-voltage alarm   |
| 02            | BatOverCurrSw    | Yes                        | Overcurrent software protection for average battery discharge current |
| 03            | BatOpen          | Yes                        | Disconnected battery alarm  |
| 04            | BatLowEod        | Yes                        | Under-voltage battery discharge stop alarm                            |
| 05            | BatOverCurrHw    | Yes                        | Battery overcurrent hardware protection                               |
| 06            | BatOverVolt      | Yes                        | Charge overvoltage protection   |
| 07            | BusOverVoltHw    | Yes                        | Bus overvoltage hardware protection                                   |
| 08            | BusOverVoltSw    | Yes                        | Bus overvoltage software protection                                   |
| 09            | PvVoltHigh       | Yes                        | PV overvoltage protection   |
| 10            | PvBoostOCSw      | No                         | Boost overcurrent software protection                                 |
| 11            | PvBoostOCHw      | No                         | Boost overcurrent hardware protection                                 |
| 12            | SpiCommErr       | Yes                        | SPI communication fault of master and slave chips                     |
| 13            | OverloadBypass   | Yes                        | Bypass overload protection  |
| 14            | OverloadInverter | Yes                        | Inverter overload protection  |
| 15            | AcOverCurrHw     | Yes                        | Inverter overcurrent hardware protection                              |
| 16            | AuxDSpReqOffPWM  | Yes                        | Slave chip OFF request fault  |
| 17            | InvShort         | Yes                        | Inverter short-circuit protection                                     |
| 18            | Bussoftfailed    | Yes                        | Bus soft-start failure  |
| 19            | OverTemperMppt   | No                         | PV heat sink over-temperature protection                              |
| 20            | OverTemperInv    | Yes                        | Inverter heat sink over-temperature                                   |

|    |                               |     | protection   |
|----|-------------------------------|-----|--|
| 21 | FanFail                       | Yes | Fan fault  |
| 22 | EEPROM                        | Yes | Memory fault   |
| 23 | ModelNumErr                   | Yes | Model setting error  |
| 24 | Busdiff                       | Yes | Positive and negative bus voltage imbalance  |
| 25 | BusShort                      | Yes | Bus short-circuit  |
| 26 | Rlyshort                      | Yes | Inverter AC output backward to bypass AC output  |
| 28 | LinePhaseErr                  | Yes | Mains input phase error  |
| 29 | BusVoltLow                    | Yes | Bus low-voltage protection   |
| 30 | BatCapacityLow1               | Yes | Alarm of battery capacity rate below 10%<br>(taking effect after BMS communication is<br>successful) |
| 31 | BatCapacityLow2               | No  | Alarm of battery capacity rate below 5%<br>(taking effect after BMS communication is<br>successful)  |
| 32 | BatCapacityLowStop            | Yes | Battery low-capacity OFF (taking effect after<br>BMS communication is successful)                    |
| 34 | CanCommFault                  | Yes | Parallel can communication fault   |
| 35 | ParaAddrErr                   | Yes | Parallel ID (communication address) setting<br>error   |
| 37 | ParaShareCurrErr              | Yes | Parallel current sharing fault   |
| 38 | ParaBattVoltDiff              | Yes | Large battery voltage difference in parallel mode  |
| 39 | ParaAcSrcDiff                 | Yes | Inconsistent mains input source in parallel mode   |
| 40 | ParaHwSynErr                  | Yes | Hardware synchronization signal error in parallel mode   |
| 41 | InvDcVoltErr                  | Yes | Inverter DC voltage error  |
| 42 | SysFwVersionDiff              | Yes | Inconsistent system firmware version in parallel mode  |
| 43 | ParaLineContErr               | Yes | Parallel connection fault  |
| 44 | Serialnumbererror             | Yes | Failure to set the serial number before<br>leaving factory   |
| 45 | Errorsettingofsplit-phasemode | Yes | Setting error of setting items in parallel mode  |
| 56 | Lowinsulation                 | No  | Abnormally low earth impedance of PV1+,<br>PV2+, and PV-   |

|    | resistancefault                 |     |   |
|----|---------------------------------|-----|---|
| 57 | Leakagecurrent<br>overloadfault | Yes | System current leakage out of the standard  |
| 58 | BMSComErr                       | No  | BMS communication fault   |
| 60 | BMSUnderTem                     | No  | BMS under-temperature alarm (taking effect after BMS communication is successful) |
| 61 | BMSOverTem                      | No  | BMS over-temperature alarm (taking effect after BMS communication is successful)  |
| 62 | BMSOverCur                      | No  | BMS overcurrent alarm (taking effect after<br>BMS communication is successful)    |
| 63 | BMSUnderVolt                    | No  | BMS under-voltage alarm (taking effect after<br>BMS communication is successful)  |
| 64 | BMSOverVolt                     | No  | BMS overvoltage alarm (taking effect after<br>BMS communication is successful)    |

# 7.2 Troubleshooting

| Fault<br>Code | Meaning   | Cause  | Solution   |
|---------------|---|--|--|
| /             | No screen display   | There is no power input,<br>or the device switch at its<br>bottom is not turned on                                   | Check if the battery air-switch or PV<br>air-switch has been closed; check if the<br>switch is in "ON"; press any button on the<br>screen to exit the screen sleep mode.   |
| 01            | Battery<br>under-voltage  | The battery voltage is<br>lower than the value set in<br>parameter [14]  | Charge the battery until the battery voltage exceeds the value set in parameter [14].  |
| 03            | Disconnected<br>battery   | The battery is not<br>connected, or the BMS of<br>the lithium-ion battery is<br>in the discharge<br>protection state | Check if the battery is reliably connected;<br>check if the circuit breaker of the battery is<br>off; ensure that the BMS of the lithium-ion<br>battery can communicate normally.  |
| 04            | Battery<br>over-discharge   | The battery voltage is<br>lower than the value set in<br>parameter 12  | Manual reset: Turn off the power, and<br>restart<br>Automatic reset: Charge the battery until<br>the battery voltage is higher than the value<br>set in parameter [35]   |
| 06            | Rechargeable<br>battery overvoltage<br>protection                                       | The battery is in the overvoltage state  | Manually turn off the power, and restart<br>Check if the battery voltage exceeds the<br>limit. If the limit is exceeded, discharge the<br>battery until the voltage is below the<br>overvoltage recovery threshold of the<br>battery |
| 13            | Bypass overload<br>(software<br>detection)  | The output power or<br>current of the bypass is<br>overloaded within a<br>certain period                             | Reduce the load power, and restart the device. For more details, please refer to   |
| 14            | Inverter overload<br>(software<br>detection)  | The output power or<br>current of the inverter is<br>overloaded within a<br>certain period                           | item 11 in <i>Protection Function</i>  |
| 19            | Over-high<br>temperature of the<br>heat sink for PV<br>input<br>(software<br>detection) | The temperature of the<br>heat sink for PV input<br>exceeds 90°C for 3s  | Wait until the temperature of the heat sink<br>is below the over-temperature recovery<br>temperature, when charge and discharge<br>return to normal  |
| 20            | Over-high   | The temperature of the   |  |

|    | temperature of the | heat sink for inverter                                |  |
|----|--------------------|---|--|
|    | heat sink for      | output exceeds 90°C for                               |  |
|    | inverter output    | 3s  |  |
|    | (software          |   |  |
|    | detection)         |   |  |
| 21 | Fan fault          | Software detection founds                             | Shut down, manually flick the fan, and       |
| 21 |                    | the fan has a fault                                   | check if any foreign objects are blocking it |
|    |                    |   | Manually shut down, and restart. If the      |
| 26 | AC input relay     | Stuck relay for AC output                             | fault occurs again after restarting, contact |
| 20 | short-circuit      | Stuck relay for AC output                             | the after-sales service personnel to repair  |
|    |                    |   | the machine                                  |
|    |                    | The phase of AC input is                              | Ensure that the phase of AC input is the     |
| 28 | Mains input phase  | The phase of AC input is<br>inconsistent with that of | same as that of AC output. For example, if   |
| 28 | fault              |   | the output is in the split-phase mode, the   |
|    |                    | AC output   | input shall also be in the split-phase mode. |

## () NOTICE

If you encounter product faults that cannot be solved by the methods listed in the above table, please contact our after-sales service department for technical support, and do not disassemble the device by yourself.

# 8. Protection Function and Product

# Maintenance

# 8.1 Protection function

| No | <b>Protection Function</b>                  | Description  |
|----|---|--|
| 1  | PV current-limiting protection              | When the charge current or power of the configured PV array<br>exceeds the rated current and power of the inverter, it will charge at<br>the rated current and power   |
| 2  | PV overvoltage protection                   | If the PV voltage exceeds the maximum allowable value of<br>hardware, the machine will report the fault, and stop the step-up of<br>PV to output sine AC waves   |
| 3  | Reverse charge<br>protection at night       | At night, as the battery voltage is greater than that of the PV<br>module, it will prevent the battery from discharging to the PV<br>module  |
| 4  | mains input<br>overvoltage<br>protection    | When the mains voltage of each phase exceeds 140 VAC, it will stop mains from charging, and switch it to inverter output   |
| 5  | Mains input<br>under-voltage<br>protection  | When the mains voltage of each phase is lower than 90 VAC, it will stop mains from charge, and switch it to inverter output  |
| 6  | Battery overvoltage<br>protection           | When the battery voltage reaches the overvoltage disconnect<br>voltage threshold, it will automatically stop PV and mains from<br>charging the battery, thus preventing damage to the battery due to<br>overcharge |
| 7  | Battery<br>under-voltage<br>protection      | When the battery voltage reaches the low-voltage disconnect<br>voltage threshold, it will automatically stop discharging the battery,<br>thus preventing damage to the battery due to overdischarge                |
| 8  | Battery overcurrent protection              | When the battery current exceeds the allowable range of hardware,<br>the machine will turn off the output, and stop discharging the<br>battery   |
| 9  | AC output<br>short-circuit<br>protection    | When a short-circuit fault occurs at the load output terminal, it will<br>immediately turn off the output of AC voltage. Only after manually<br>powering on the device, normal output restores                     |
| 10 | Heat sink<br>over-temperature<br>protection | When the internal temperature of the inverter is too high, the<br>inverter will stop charging and discharging; when the temperature<br>returns to normal, the inverter will charge and discharge again             |
| 11 | Overload protection                         | After overload protection is triggered, the inverter output will be restored after 3 min, and after 5 times of overload, the output will   |

|    |                               | be off until the frequency changer is restarted.                      |
|----|-------------------------------|---|
|    |                               | (102% < load <110%): An error will be reported, and the output will   |
|    |                               | be turned off after 5 min.  |
|    |                               | (110% < load <125%): An error will be reported, and the output will   |
|    |                               | be turned off after 10s.  |
|    |                               | Load >125%: An error will be reported, and the output will be         |
|    |                               | turned off after 5s.  |
| 12 | AC backward protection        | Prevent the mains of battery inverter backward to bypass AC input     |
| 13 | Bypass overcurrent protection | Built-in circuit breaker for AC input overcurrent protection          |
|    |                               | When the phase of the two bypass inputs is different from that of     |
| 14 | Bypass wiring error           | the inverter split-phase, the machine will prohibit connecting to the |
| 14 | protection                    | bypass, thus preventing the power failure or short circuit of load    |
|    |                               | when connecting to the bypass   |

In order to maintain the best long-term performance, it is recommended to conduct following checks twice a year.

- 1. Make sure that the airflow around the inverter is smooth, and remove any dirt or debris from the heat sink.
- 2. Check whether the insulation of all exposed wires is damaged by exposure to sunlight, friction with other objects around them, dryness, bite by insects or rodents, etc. Repair or replace wires if necessary.
- 3. Verify the consistency of the indication and display with the device operation. Please pay attention to any faults or errors, and take corrective actions if necessary.
- 4. Check all wiring terminals for corrosion, insulation damage, and signs of high temperature or burning/discoloration, and tighten the terminal screws.
- 5. Check for dirt, nesting insects, and corrosion, clean up as required, and clean the insectproof net regularly.
- 6. If the arrester fails, replace it in time against lightning damage to the inverter or even other devices of the user.

## A DANGER

• Before conducting any inspection or operation, please ensure that the inverter is disconnected from all power sources and that the capacitor is fully discharged to avoid the risk of electric shock.

#### Our company will not be held responsible for damage due to the following reasons:

- 1. Damage caused by improper use or use in the wrong location.
- 2. The open circuit voltage of the PV module exceeds the maximum allowable voltage.
- 3. The operating temperature exceeds the limited operating temperature range.
- 4. Unauthorized personnel dismantle, and repair the inverter.
- 5. Force majeure: damage during transportation or handling of the inverter

# 9. Data sheet

| Inverter Model                               | ASP4840U100-H  | ASP4850U120-H | ASP4860U140-H | ASP4865U140-H | Settable |
